S&P GLOBAL & CRISIL CAMPUS HACKATHON

Trading Wens

From live market evidence to position-aware risk

A paper-trading intelligence workspace that connects provider data, trained financial sentiment, directional signals, and portfolio exposure without hiding uncertainty.

LIVE MARKET CONTEXT

TRAINED FINBERT

PAPER EXECUTION

CANDIDATE

Shivansh Dwivedi

COLLEGE / CAMPUS

IIIT Nagpur

SUBMISSION 2026

Four disconnected views. One decision loop.

The project treats news sentiment as evidence, then asks whether it matters to the position the user actually holds.

1

Market

Price, range, volume, and current session movement

2

News

Authenticated and public headlines with trained sentiment

3

Position

Live quantity, side, market value, and unrealized P/L

4

Decision

Movement label, confidence, and adverse exposure

THE CORE RULE

Risk depends on direction × position

A predicted fall raises risk for a long position but reduces directional risk for a short position. A sideways label means the combined evidence does not clear the directional threshold.

LONG + DOWNSIDE

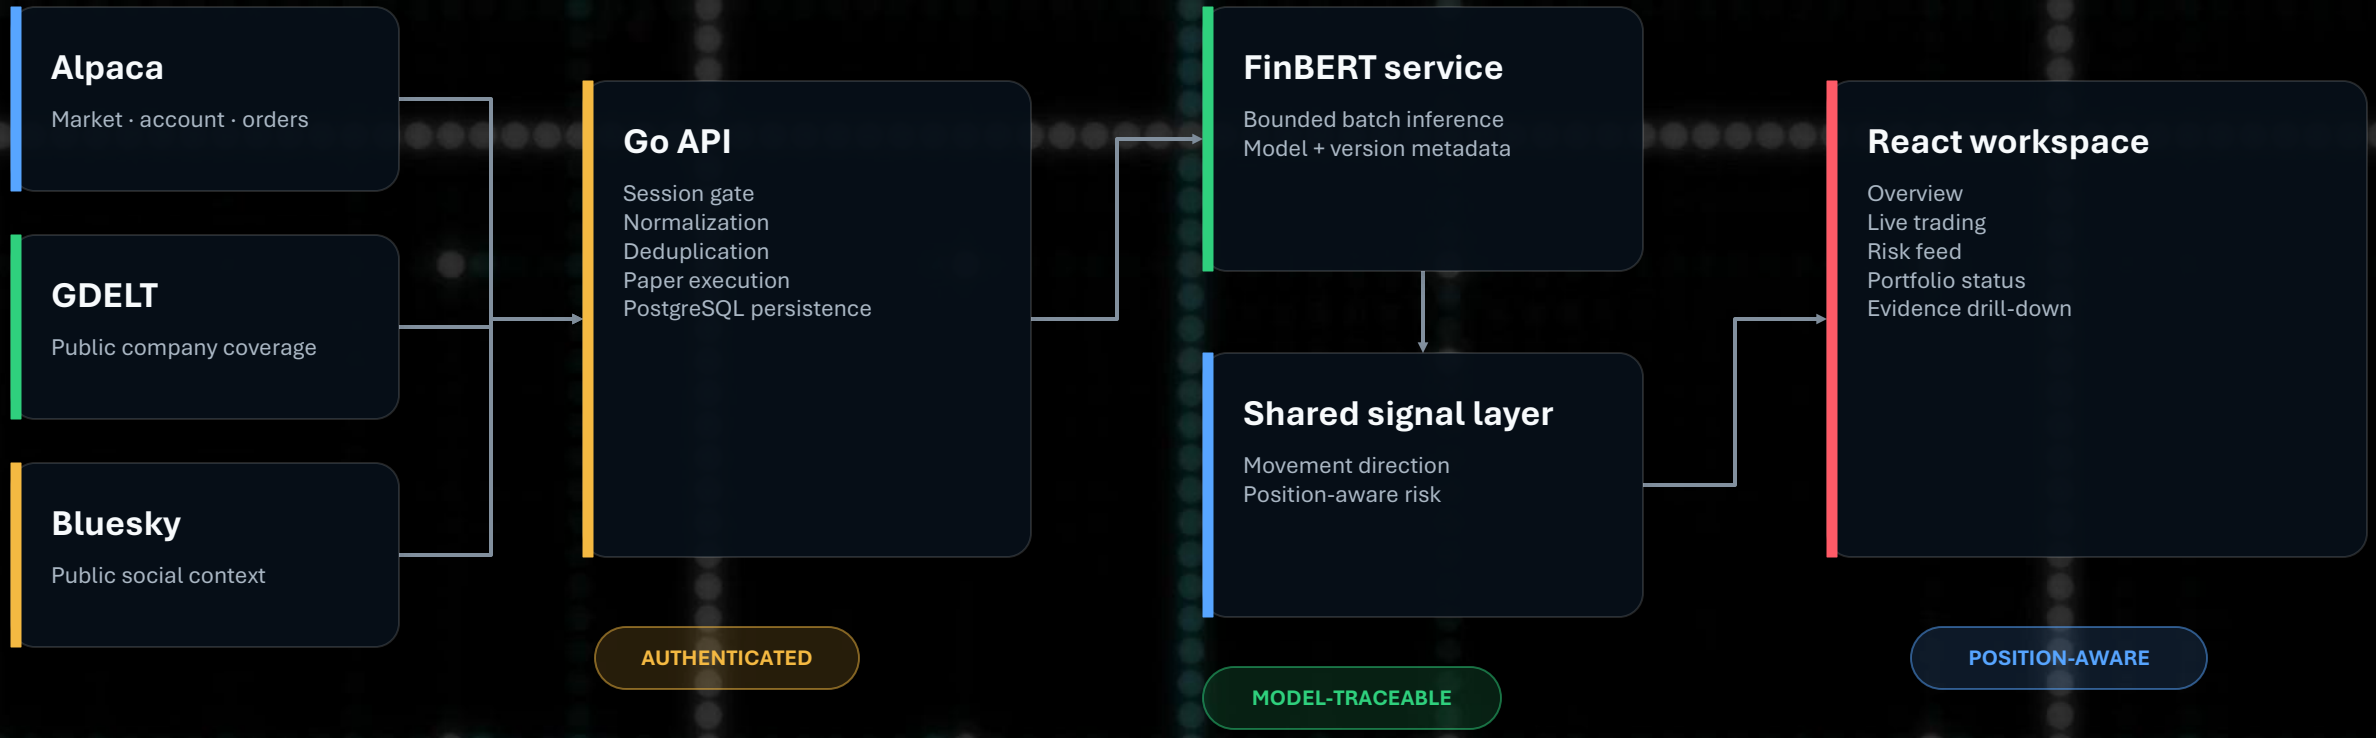

RISK

LONG + UPSIDE

ALIGNED

A bounded, traceable path from source to screen.

Provider-specific payloads stop at the API boundary. Every downstream view consumes normalized contracts.

Built for evidence, not theatre.

The strongest engineering decisions are the ones that prevent a polished dashboard from making an unsupported claim.

Truthful data states

Live provider data remains authenticated. Public demo fixtures stay labelled synthetic. Missing model output remains unavailable.

NO FABRICATED FALLBACK

Model traceability

FinBERT loads once, accepts bounded batches, returns calibrated confidence, uncertainty, labels, and model version.

BATCH ≤ 16 HEADLINES

Execution auditability

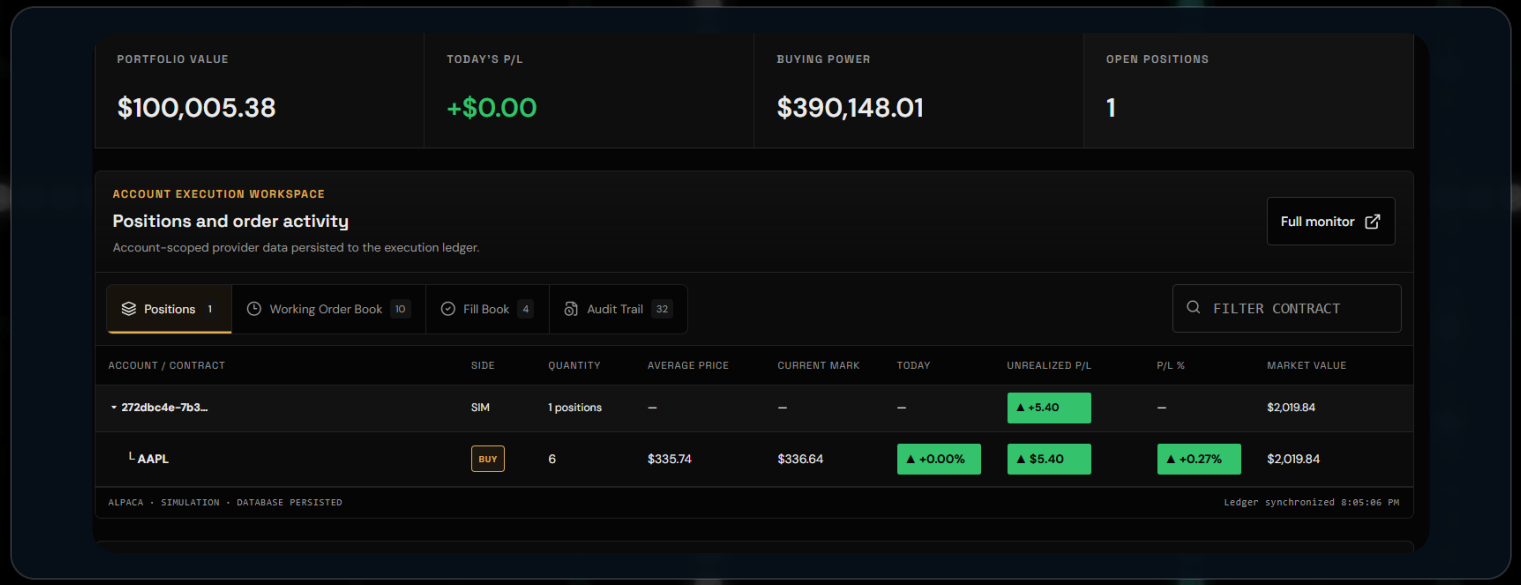

Paper orders require confirmation. Orders, fills, audit events, account snapshots, and sentiment evidence are persisted.

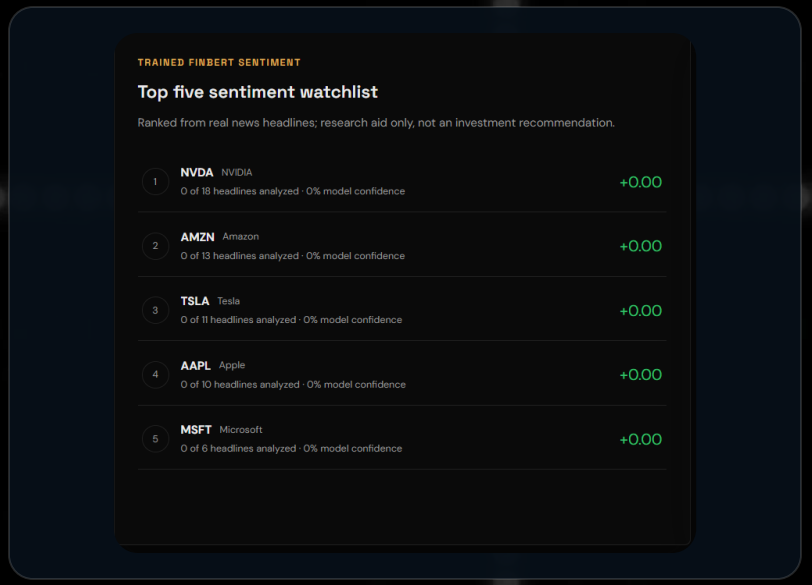

PAPER ENDPOINT ONLY

REACT 19	GO	POSTGRESQL	PYTORCH	ALPACA + GDELT
Authenticated UI	API + domain	Durable ledger	FinBERT inference	Market + news

One account view, refreshed after every trade.

The implementation now connects real positions to trained headline analysis and the same directional signal used across the workspace.

30
MAINTAINED LARGE-CAP STOCKS

50
MAXIMUM AGGREGATED ARTICLES

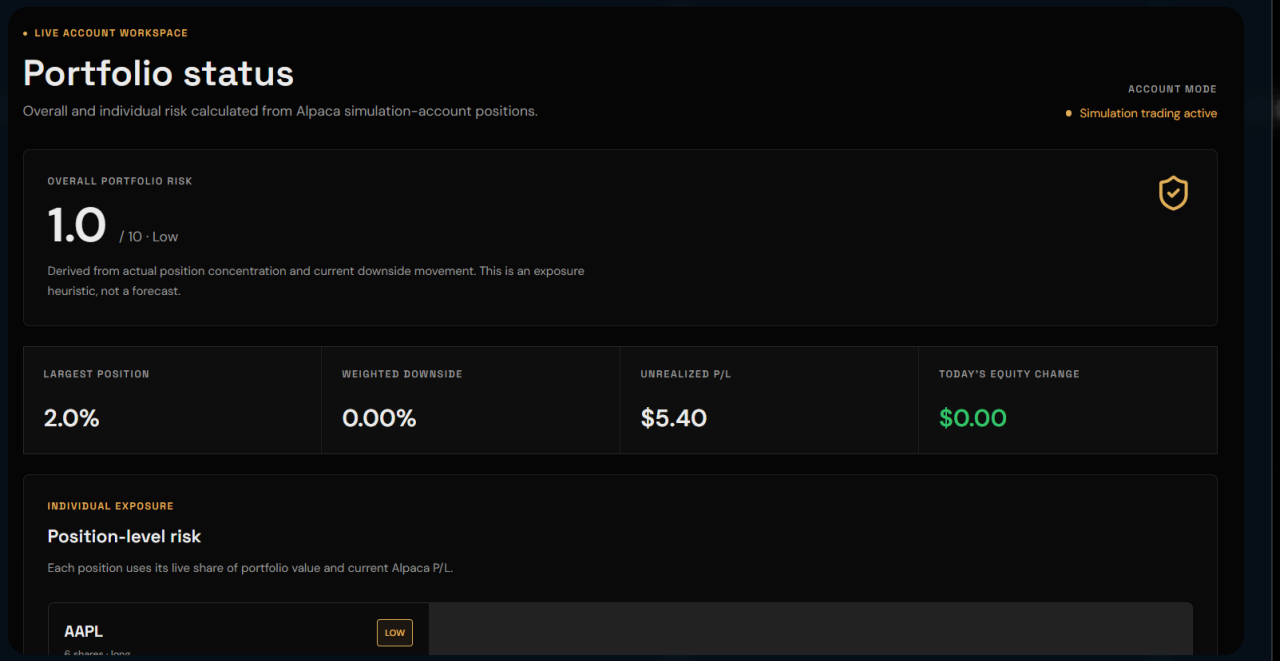

16
HEADLINES PER MODEL BATCH

27
FRONTEND TESTS PASSING

1
SHARED MOVEMENT PREDICTION

A clearer bridge from event intelligence to exposure.

For financial research teams, speed matters only when the evidence and the affected position remain visible together.

WHY THIS MATTERS

Surveillance

Rank issuer events by evidence, direction, and exposure instead of headline volume alone.

Explainability

Keep source URLs, model identity, confidence, current mark, and position side in the review path.

Portfolio context

Aggregate individual adverse exposure into one interpretable portfolio signal without losing symbol-level detail.

Extendable to issuer monitoring, credit events, and index constituents

Keep the signal honest. Make the evidence stronger.

The current system is a working decision-support prototype. The next phase is disciplined validation, not a larger promise.

CURRENT LIMITS

No price guarantee

Direction is a thresholded signal, not a forecast contract or investment recommendation.

Provider dependence

Coverage and freshness depend on entitlement, publication latency, and source availability.

Heuristic portfolio risk

The score is interpretable exposure, not full VaR, stress loss, or regulatory capital.

NEXT THREE RELEASES

01

Calibrate

Walk-forward evaluation and neutral thresholds

02

Cluster

Group repeated coverage into one event

03

Monitor

WebSockets, drift, latency, and provider health

Trading Wens

Evidence first. Position aware. Explicitly uncertain.
